LEARNING ABOUT MRSA

What is MRSA and why is it so serious?

Some germs that commonly live on the skin and in the nose are called staphylococcus or "staph" bacteria. Usually, staph bacteria doesn't cause harm. However, sometimes they get inside the body through a break in the skin and cause an infection: These infections are usually treated with antibiotics. When common antibiotics do not kill the staph bacteria, it means the bacteria have become resistant to those antibiotics. This type of staph is called MRSA (Methicillin-Resistant Staphylococcus Aureus).

Anyone can get MRSA. Infections range from mild to very serious, to even life-threatening. MRSA is contagious and can be spread to other people through skin-to-skin contact. If one person in a family is infected with MRSA, the rest of the family may get it.

What does MRSA look like?

Most often, MRSA causes infections on the skin. These infections may look like anyone of the following:

- Sores that look and feel like spider bites
(However, MRSA is not caused by a spider bite.)
- Large, red, painful bumps under the skin (called boils)
- A cut that is swollen, hot and filled with pus
- Blisters filled with fluid (called impetigo)

It is also possible to have MRSA in other areas of the body, such as blood, lungs, eyes, and urine. These types of infections are less common, although often more serious.

LEARNING ABOUT MRSA

How did I get MRSA?

Anyone can get MRSA. You can get MRSA the same way you can get a cold, such as by touching someone or something that has the bacteria on it and then touching your eyes or your nose. Washing your hands often reduces your chances of getting MRSA.

MRSA can live on surfaces and objects for months. However, it can be killed through proper cleaning methods. (See page 10)

Some ways that you could get MRSA:

- Touching the infected skin of someone who has MRSA.
- Using personal items of someone who has MRSA, such as a towel, wash cloths, clothes, razors, or athletic equipment.
- Touching objects, such as public phones or doorknobs, that have MRSA bacteria on the surface.
- Being in crowded places where germs are easily spread, such as hospitals, nursing homes, daycares or college dorms.

You may increase your chances of not have symptoms that getting MRSA if:

- You take antibiotics frequently.
- You take antibiotics without prescription.
- You don't follow directions when taking antibiotics such as stopping early or missing doses.

You are at greater risk of getting MRSA if you are recovering from surgery or bums, have tubes in your body for medical treatment, or if you share needles.

There are two ways you can have MRSA.

- 1. You can have an active infection.**
An active infection means you have symptoms. The types of symptoms depend on where the bacteria are located. Usually an active infection is a skin infection, such as a boil, a sore, or an infected cut.
- 2. You can be a carrier.**
If you are a carrier you do not have symptoms that you can see, but you still have MRSA bacteria living on your skin and in your nose. If you are a carrier, your provider may say that you are colonized. These words – “carrier” and “colonized” – mean the same thing.

Will I always have MRSA?

Maybe. Many people who have active infections are treated and no longer have MRSA. However, sometimes MRSA goes away after treatment and comes back several times. If MRSA infections keep coming back again and again, your health care provider can help you sort out the reasons you keep getting them.

Even if active infections go away, you can still have MRSA bacteria on your skin and in your nose. This means you are now a carrier of MRSA. You may not get sick or have any more skin infections, but you can spread MRSA to others. It is not fully understood why some people are carriers of MRSA, yet don't get infections.

How contagious am I?

If you have an active MRSA infection on your skin, it is contagious. If someone touches your infections, or touches something that came in contact with your infections (like a towel), that person could get MRSA.

If you are a MRSA carrier, you still have the bacteria on your skin and in your nose. If you don't wash your hands properly, things that you use or touch with your hands can give the bacteria to other people. MRSA can also be found in the liquid that comes out of your nose or mouth when you cough or sneeze.

Remember, if you have MRSA it is possible to spread it to family, friends, other people close to you, and even to pets. Washing your hands and preventing others from coming in contact with your infections are the best ways to avoid spreading MRSA.

Is there a test for MRSA?

You would not usually be tested for MRSA unless you have an active infection. If you have a skin infection, your health care provider may take a sample of the fluid. This is called taking a culture. The lab will then test the bacteria to find out which antibiotic is best for you.

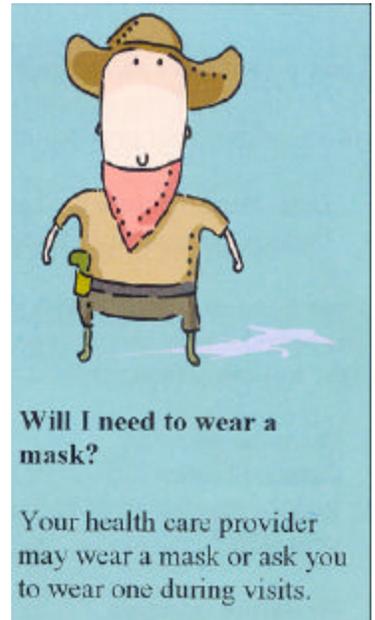

If your MRSA infections keep coming back again and again, your health care provider may test you or your family members to see if you are carriers. In this case, the provider would take a culture sample from the nose, where MRSA is often found.

LEARNING ABOUT MRSA

If I have MRSA, do I need to do anything special when I go to a clinic or hospital?

If you've ever had an active MRSA infection, or you are a carrier, tell all of your health care providers. They will wash their hands and may wear gloves when caring for you. They may also wear a gown to prevent getting the bacteria on their clothes. If you are coughing, they may wear a mask or ask you to wear one. They will always wear gloves when caring for a wound.

If you are staying in a hospital nursing home, a "Contact Precautions" sign may be put on the door of your room. This card alerts staff to use extra care to prevent the spread of MRSA. Your visitors may be instructed to avoid touching infected skin and take other precautions.

TREATING MRSA

How is MRSA treated?

MRSA should always be treated by a health care provider. It is important to follow the instructions for treatment that your provider gives you.

If you do not have an active infection, your health care provider may do tests to find out if you still carry MRSA bacteria on your skin. If you are a MRSA carrier, your provider may decide to:

- Do nothing, because the bacteria may go away without treatment
- Reduce the amount of bacteria on your skin

If you have an active MRSA infection, your provider may choose one or more of the following treatments:

1. Drain the infection
2. Give antibiotics
3. Reduce the amount of bacteria on your skin

1. Drain the Infection

Don't do this yourself. It is very dangerous to squeeze or poke a skin infection because it can push the bacteria deeper into the skin and make the infection worse. Draining the infection should only be done by a trained health care provider.

The provider will open the sore and drain it. After the infection is drained, you must keep it covered until it heals. Sometimes your provider may ask you to come back for a checkup or to change the dressing. This is to make sure it is healing okay. Some skin infections will heal after your health care provider has drained the pus out. You may not need an antibiotic.

If your provider gives you antibiotics:

Take them exactly as prescribed. Do not stop early, even if you feel better. The last few pills kill the toughest germs.

TREATING MRSA

2. Give antibiotics

MRSA is resistant to many antibiotics so it can be difficult to treat. However, there are antibiotics that can treat MRSA and make the infection go away. Your provider may culture your infection and have the lab test the bacteria to find out which antibiotic is best for you. If your provider gives you antibiotics, take them exactly as prescribed. Do not stop early, even if you feel better. The last few pills kill the toughest germs. Never take antibiotics without a prescription from your health care provider.

3. Reduce the amount of bacteria on your skin or in your nose

This may prevent the spread of MRSA if you have an active infection or if you are a carrier.

To decrease the amount of bacteria on your skin, your provider may for a short period of time:

- Have you shower daily with antibacterial soap
- Prescribe antibiotic pills
- Prescribe antibiotic ointment to put in your nose for several days

Directions for putting ointment in your nose:

1. Put $\frac{1}{4}$ inch dab of ointment on a cotton swab (Q-tip)
2. Insert the swab as far into your nose as you can tolerate
3. Gently rub the swab on the inside of your nostril, using a circular motion.
4. Using a new swab, repeat with the other nostril 5. Dispose of the swabs 6. Wash your hands

When should I seek medical care?

- If you have any new symptoms during or after treatment for MRSA skin infection
- If the infection does not get better .
- If the infection gets worse
- If the infection comes back

CARING FOR YOURSELF

Practice good hygiene to reduce the amount of bacteria on your skin?

Wash your hands often and shower daily. Washing your hands is the number one way to stop the spread of MRSA bacteria.

Does it matter how I wash my hands?

Yes. You have to wash carefully to get rid of the bacteria. Also, you can spread MRSA to people you live with if you share towels. Make sure you have your own hand towel to dry your hands on.

This is the hand washing method recommended by health care providers:

- Wet your hands first under warm
- Apply soap and rub together for at least 15 seconds, getting between the fingers and around nails.
- Rinse with warm running water.
- Dry with a paper towel or hand towel. this includes items
- Turn the faucet off using a paper towel or hand towel (remember, your hands were dirty when you turned the faucet on).
- Throw the paper towel in the trash. If you are using a hand towel, do not share it with other people and wash it often.

Always wash your hands thoroughly:

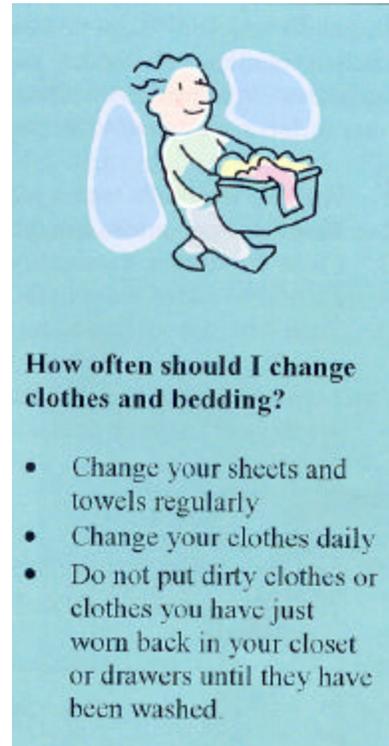

- Before preparing food, eating, or drinking
- Before and after touching your eyes, nose, mouth, genitals, sores, acne, boils, or rashes
- Before and after changing bandages
- Before and after smoking
- Before and after blowing your nose
- After touching urine, feces, and body fluids – this includes items soiled with body fluids, such as bedding
- After cleaning the bathroom, changing your bedding, and doing laundry
- After going to the bathroom
- After coughing or sneezing
- After touching things other people touch, such as phones, door knobs, or shopping carts
- After removing gloves

CARING FOR YOURSELF

Do I need to be careful when I do laundry?

Yes. Dirty clothes and bedding can spread MRSA bacteria.

- When collecting your laundry or changing your sheets, hold the dirty laundry away from your body and clothes. This will prevent getting any bacteria on your clothes.
- Wash your laundry with warm or hot water. Use bleach if possible.
- Dry in a warm or hot dryer and make sure the clothes are completely dry.
- Wash your hands after handling dirty sheets or clothing and before handling clean laundry.

How often should I change clothes and bedding?

- Change your sheets and towels regularly
- Change your clothes daily
- Do not put dirty clothes or clothes you have just worn back in your closet or drawers until they have been washed.

CARING FOR YOURSELF

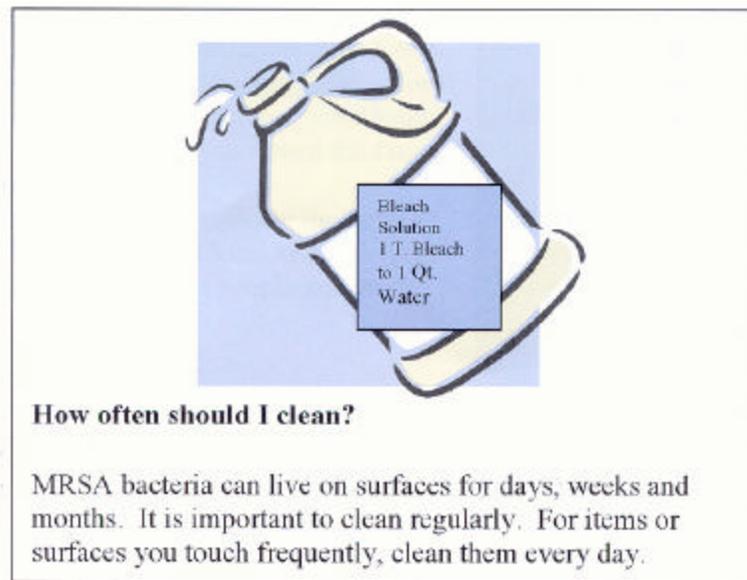

What about cleaning my house?

Use a disinfectant to regularly clean surfaces. Pay attention to items that are frequently touched - light switches, doorknobs, phones, toilets, sinks, tubs, kitchen counters, cell phones, pagers, and computer keyboards. Wipe the surface or object with a disinfectant and let it dry. If body fluids or pus get onto surfaces, you need to do the following:

1. Wipe up the fluids with a paper towel.
2. Throw the paper towel in the trash.
3. Clean the surface thoroughly using disinfectant and a paper towel.
4. Throw the paper towel in the trash.
5. Then wipe the surface again with the disinfectant and let it dry for at least 30 seconds.
6. Throw the paper towel in the trash.
7. Wash your hands or use an alcohol-based hand sanitizer.

Disinfectants to use

- Use any cleaner you can buy at the grocery store that has the word "disinfectant" on it. Remember to read the label and follow the directions.

CARING FOR YOURSELF

Personal Care Guidelines

- Wash your hands frequently.
- Carry alcohol-based hand gel with you so you can sanitize your hands if soap and water are not available.
- Cover your nose and mouth with a tissue when you cough or sneeze. Throw the tissue in a wastebasket and wash your hands.
- Take a bath or shower every day. This will help reduce the amount of bacteria on your skin.
- Keep your fingernails short to keep the bacteria from growing under and on your nails.
- Change your sheets and towels on a regular basis and when soiled. Clothes should be washed in warm or hot water and dried in the dryer.
- Change your clothes daily and wash them before wearing again.
- Do not share towels, razors, tooth-brushes, or other personal items.
- Take good care of your skin. Remember, MRSA lives on your skin. Any break or crack in your skin can allow it to enter and cause an infection. If you get a cut or scrape, clean it with soap and water and then cover it with a bandage.
- Take care of yourself: eat right, exercise, quit smoking, and avoid stress.
- Get medical care at the first sign of infection in a cut, such as redness, swelling, pain, or pus.
- Tell your health care providers that you have had MRSA in the past. . If you work in a health care setting, you may need to take special precautions. Consult with your employer.

CONTROLLING MRSA

How do I stop MRSA from spreading when I have an active infection?

- Follow the "Personal Care Guidelines" on page 11.
- Do not poke or squeeze the sores.
- Do not touch sores, especially ones that cannot be covered with a bandage or clothing, such as sores on your face. If you do touch a sore, wash your hands immediately.
- Cover any infected sores with a bandage. Wash your hands immediately after putting on the bandage.
- If you have a leaking sore, put extra dressings over it to keep the drainage from leaking through. Be careful not to get any pus or body fluids on surfaces, or other people.
- Wear clothes that cover your bandages and sores, if possible.
- Be especially careful if you are around people who have weak immune systems, such as newborn babies, the elderly, or anyone with a chronic disease. If they get MRSA, it can make them very ill.
- Be careful if you are around someone who has a skin condition, such as eczema, or someone who just had surgery. They may be more likely to get an infection.
- If MRSA is in your urine or stool, clean your bathroom well. If other people handle your urine or stool, they should wear gloves and wash their hands well afterwards.
- Do not participate in contact sports until your sores have healed (sweating can cause a bandage to loosen and lead to contact with equipment and other people).
- Do not go to a public gym, sauna, hot tub or pool until sores have healed.
- Do not get manicures, massages or hair cuts until sores have healed.

CONTROLLING MRSA

How do I stop MRSA from spreading when I'm a carrier?

- Follow the "Personal Care Guidelines" on page 11.
- If you go to a gym, disinfect all equipment after using it. This is standard policy for gyms, and the gym should provide the disinfectant.
- Shower well with soap before and after using a public sauna, hot tub or pool.
- Shower immediately after participating in sports or working out at the gym.
- Shower before any intimate skin-to-skin contact with another person. Showering will reduce the amount of bacteria on your skin and reduce the risk of spreading bacteria to the other person.

Children and MRSA

If you have MRSA and there are children in your life, you can still interact with them. Washing your hands and preventing children from coming in contact with your infections are the best ways to avoid spreading MRSA. Closely follow the "Personal Care Guidelines," especially when children are present. Make sure children wash their hands, too.

If a child in your family has MRSA, teach the child what it means to have a contagious infection. Your child is likely to be in contact with other children. If your child is in daycare, make a plan with the daycare provider to reduce the risk of spreading MRSA to other children. If your child is in school, make a plan with the school nurse.

Pets and MRSA

Pets, such as dogs and cats, can also get MRSA. Pets can have active infections or they can be carriers. If you keep getting MRSA infections, or if you see any signs of a skin infection on your pet, talk with your vet about testing your pet. Pets with MRSA can be treated. You do not need to get rid of your pet. If your pet is diagnosed with MRSA, then the "Personal Care Guidelines" on page 11 apply to your pet as well. Do not touch your pet's infections and make sure to wear gloves when changing bandages. Consider keeping children separate from the pet until its sores have healed.
